Secret Garden Kindergarden

Student Work
Tehran 2010

Spatial design for keeping and educating the children under 12 is the main subject of this project. Considering to the child's main understanding of the home and trying to create interaction between them is one of the main goals of this project. Using of the simple and tangible shapes for children and non-linear circulation is the product of this approach.

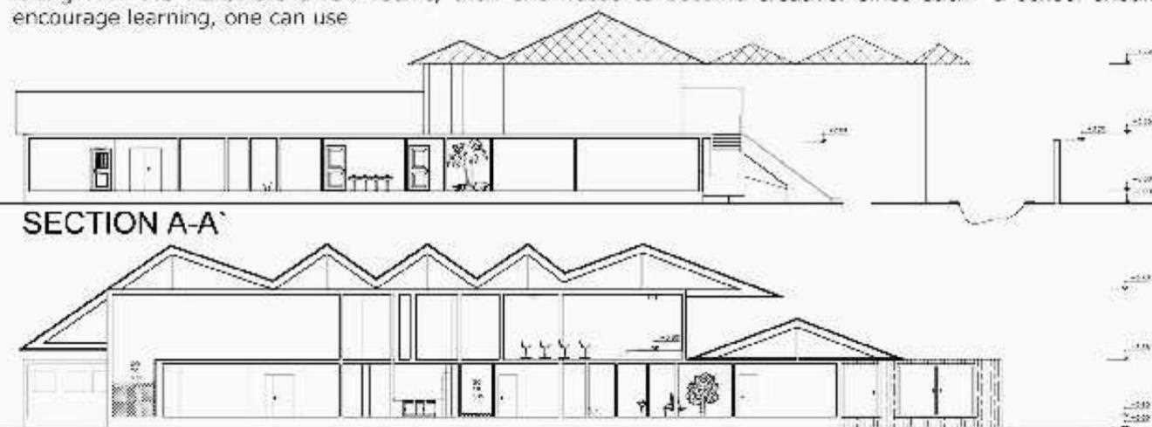

The child's dream home

The children dream homes

Our concept

The size of the center will also influence many design decisions. When there are many rooms, you can allocate different classrooms, activity centers, napping, eating areas and so forth. When there are innovative means such as child size bookshelves, storage bins and other innovative accessories which can help to save space as well as help children to learn to pick up books, arrange their toys and other skills. The entire ambience needs to be warm, comfortable and hence one needs to keep an eye on the colorful furnishings and attractive floor covering along with the walls. are a few rooms, then one needs to become creative. Since such a school should encourage learning, one can use

SECTION B-B

Preschool designs or play school designs are all the rage with the number of preschools and montessori centers that are coming up in every nook and corner of the country. With the increased private players in this area, people are finding innovative themes, ideas to make their preschool more promising than the other and the interiors and exteriors also play an important role in preschools attractive and appealing to prospective customers. When designing preschool centers the primary focus should be on the color palette. In such schools it is advisable to use primary colors and to use them in the center mostly. Red, black and white are the colors that catch the attention of babies and toddlers & these are high contrasting colors. Different rooms or areas can have different colors as well.

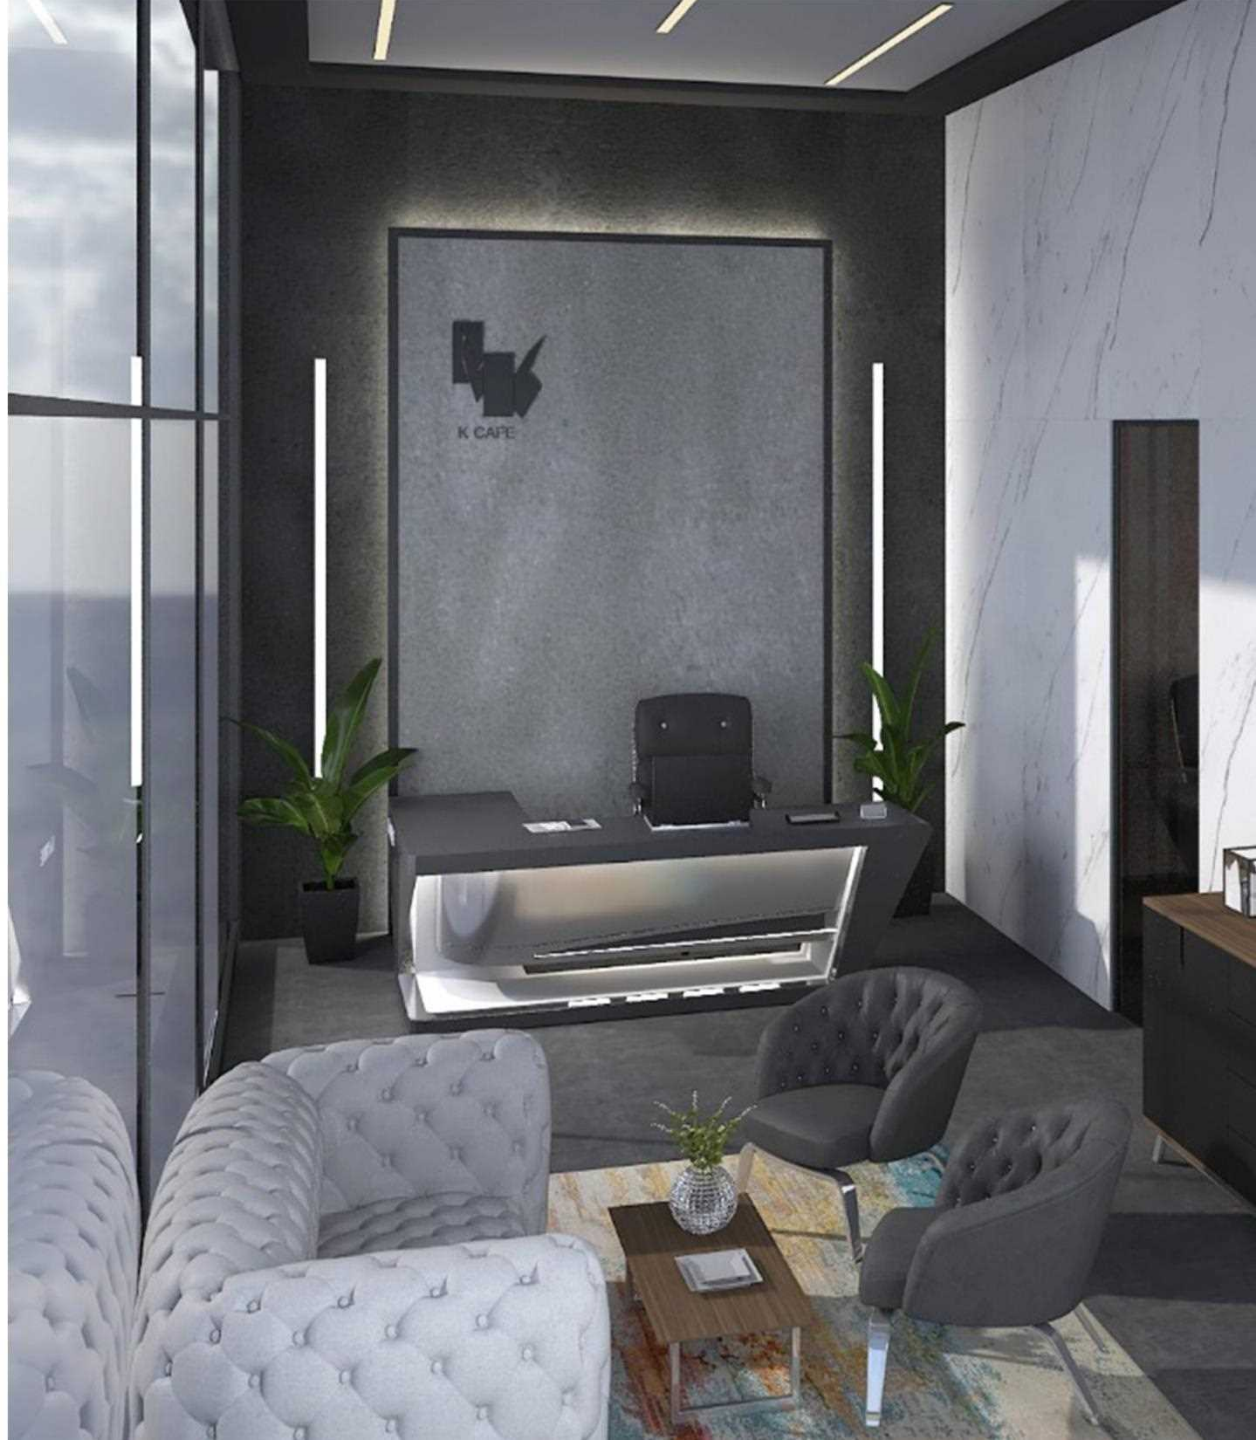

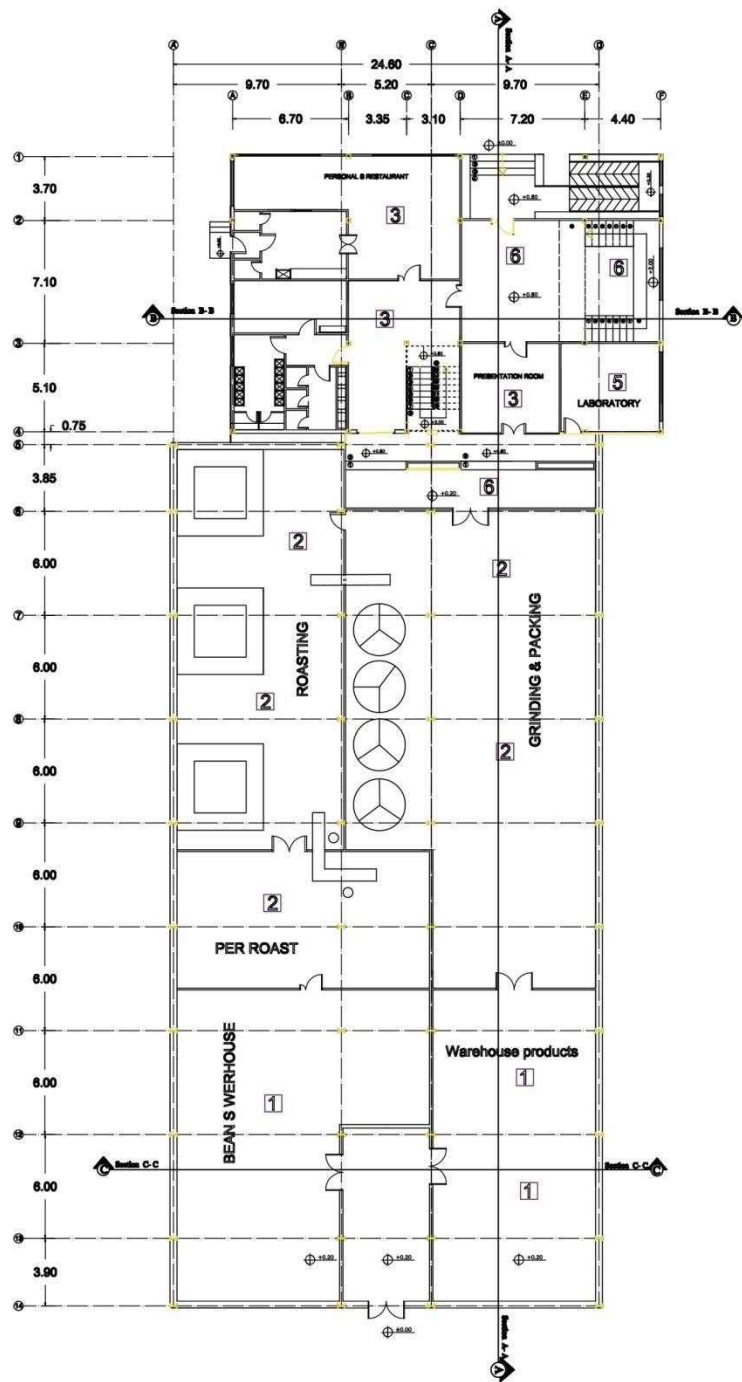

K-Cafe Factory

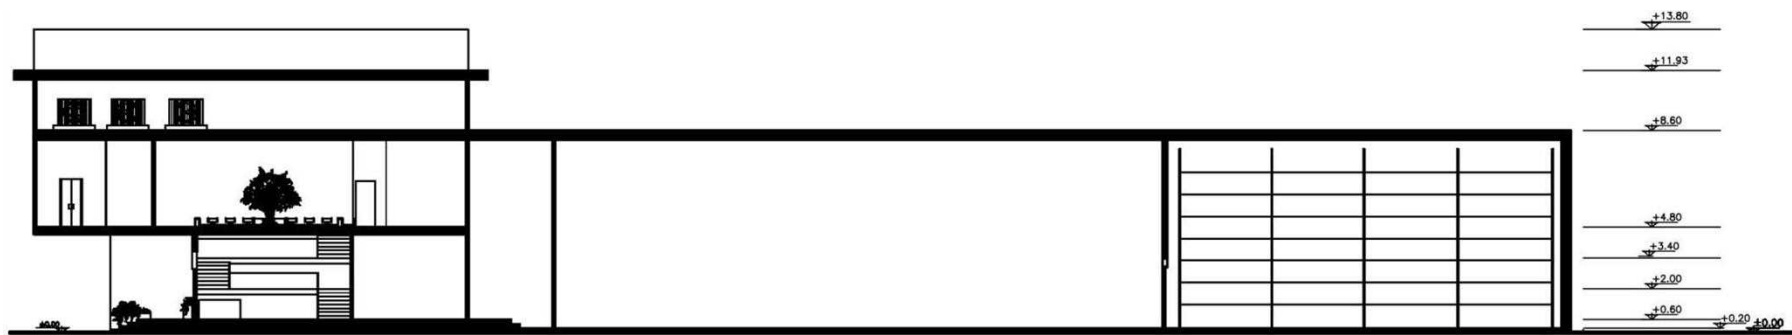

Personal Work
Tehran 2021

KCafe Manufactory located in Zagros industrial town in Kermanshah city consists of two buildings, one is administrative department and the other is a workshop for processing and packing coffee in 4000 square meters. The design of this project is inspired by the historic building of Biston and the adjacent mountains.

Kamran Street N°4

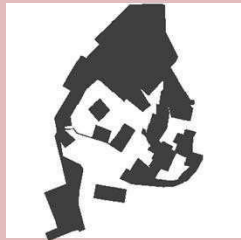

Residential building
Tehran 2018

The luxurious, 9-storey apartment house in the elegant Fereshteh quarter in the northern section of Tehran is especially tailored to affluent couples. With reference to urban construction, it is the first of its kind in Tehran to display innovative design by Hadi Teherani throughout the structure. When viewed from outside, the exterior of the building bearing the name N°4 (Kamran Residence) draws attention due to a skilfully varied and graphically three-dimensional façade scenario. Mobile screens made of a metal weave featuring modernly interpreted ornaments serve as individual shielding between privacy and the public sphere.

Castelnuovo d'Avane

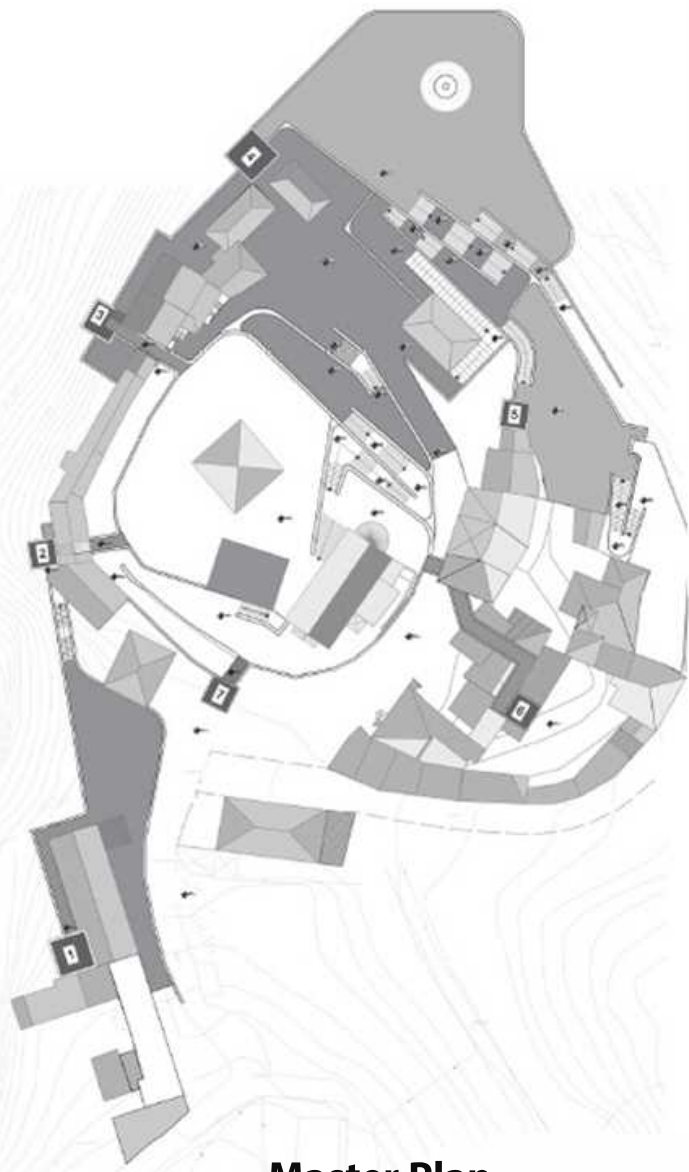

July 2024- Tuscany- Italy

The redevelopment proposal for the abandoned village of Castelnuovo d'Avane in Tuscany focused on transforming the historic settlement into a tourist destination and residential community for ENEL employees while preserving its original identity. Inspired by Tuscany's medieval towers, seven vertical tower elements were introduced across the site to improve circulation and connectivity through stairs and elevators. The project included boutique hotels, galleries, retail spaces, and residential units, all designed with careful attention to pedestrian and vehicular access. Materials such as terracotta and clay-based finishes were selected to maintain the authentic character of the village. This academic project was developed in the Architectural Design Studio IV course in collaboration with Archea Associati under the supervision of Marco Casamonti.

HOUSE OF FUTURE

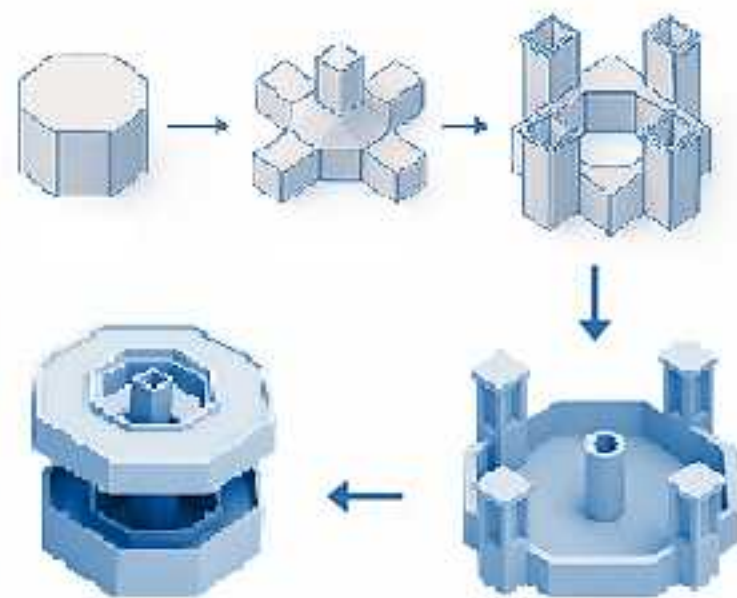

Architecture Master Thesis

July 2025- Abu Dhabi

The “House of the Future” was designed as part of a competition organized by the government of United Arab Emirates, with a strong emphasis on Emirati culture, tradition, and sustainable architecture.

The project is based on passive cooling strategies and was inspired by the natural ventilation system of termite mounds as well as traditional wind towers. Through detailed environmental analysis and careful study of their orientation and performance, the weaknesses of conventional wind towers were improved and enhanced.

1 Wind catcher

Cold air enters from the north and northwest vents and hot air exits from the south and southeast vents.

2 solar chimney

Creating warm air through mirrored panels to absorb warm air and ultimately circulate air in hot and humid weather.

3 Central Channel

The vertical shaft of hot air, derived from the Termite house system, circulates air due to convection currents.

4 Canopy

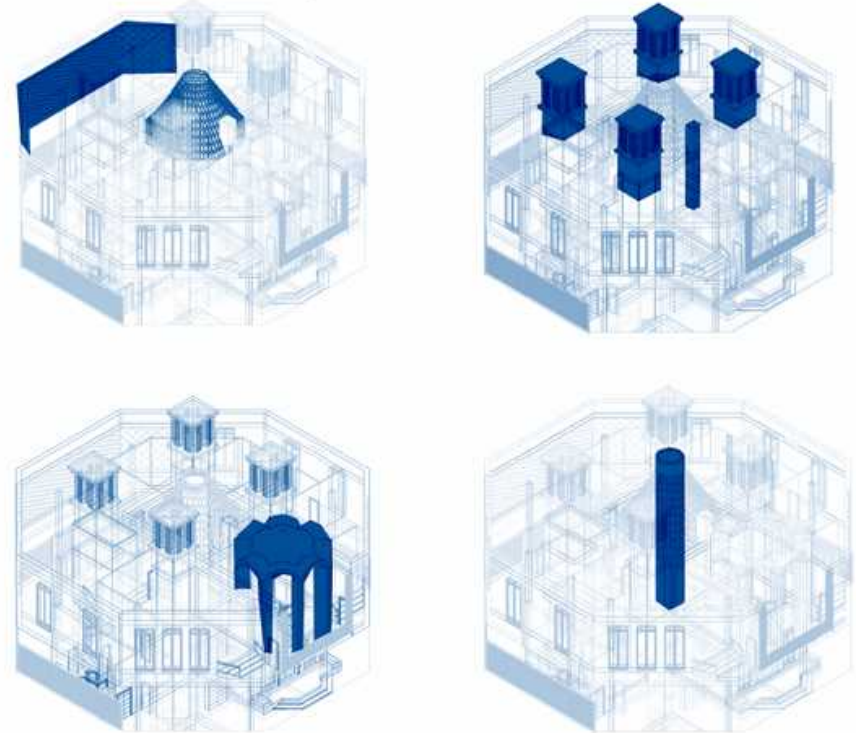

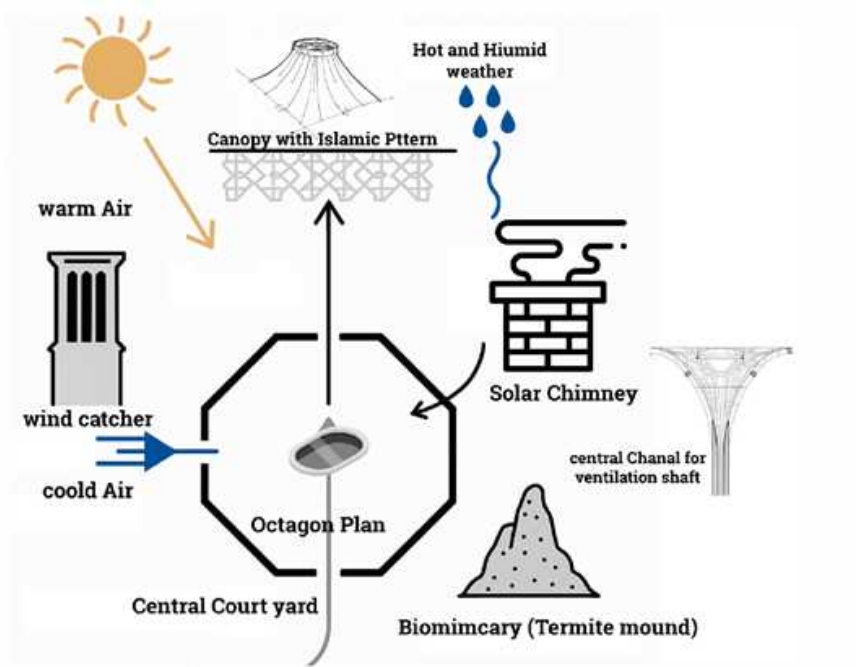

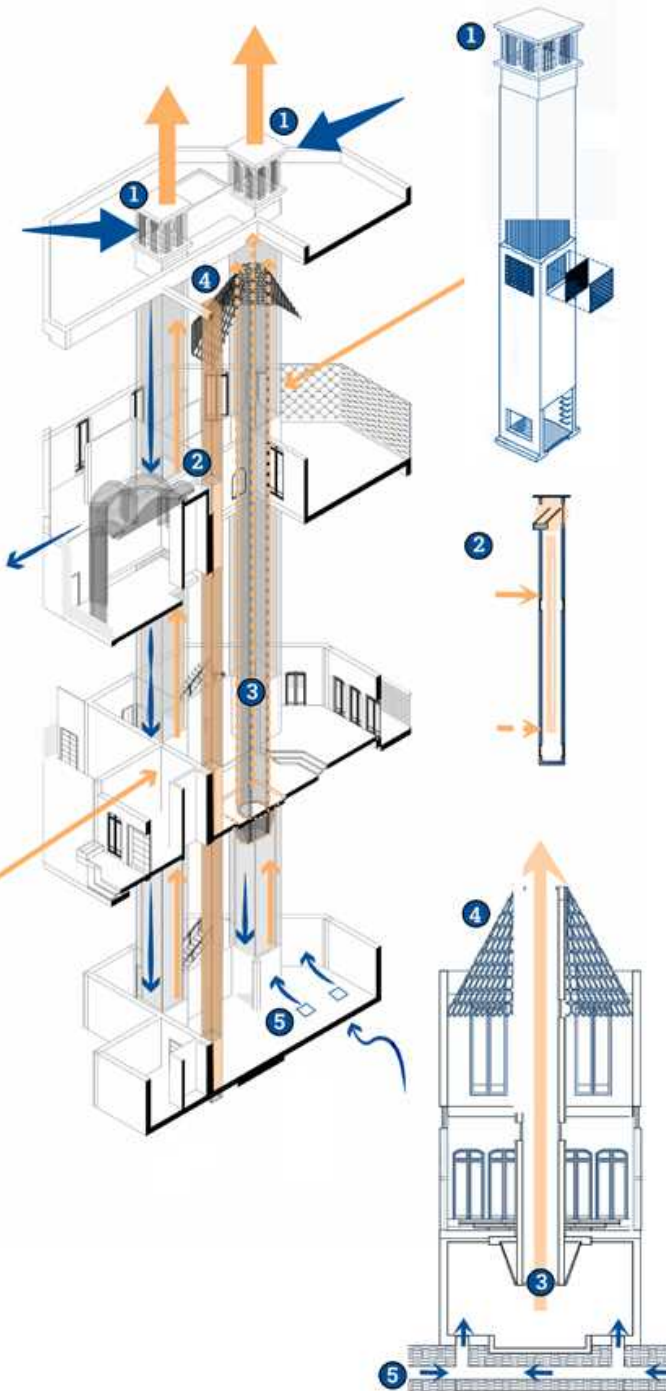

A canopy with a patterned texture that provides shade in the central courtyard.

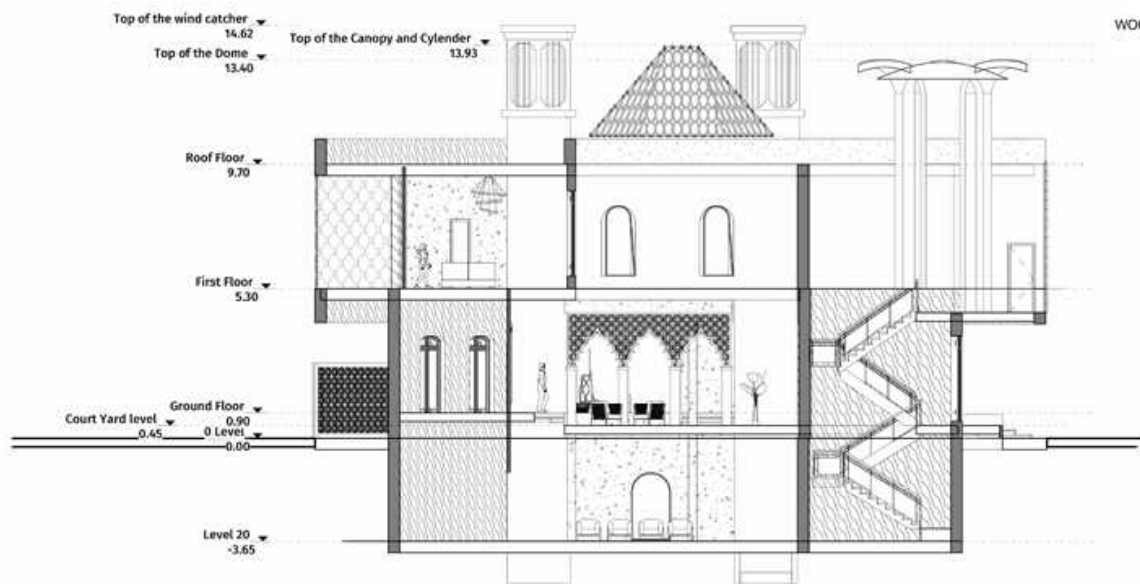

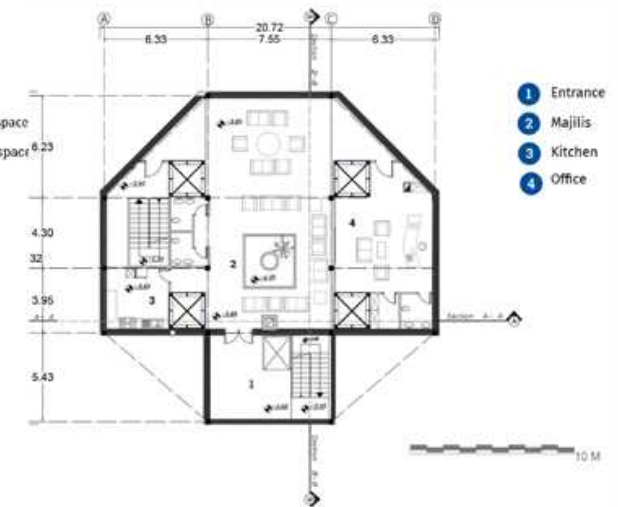

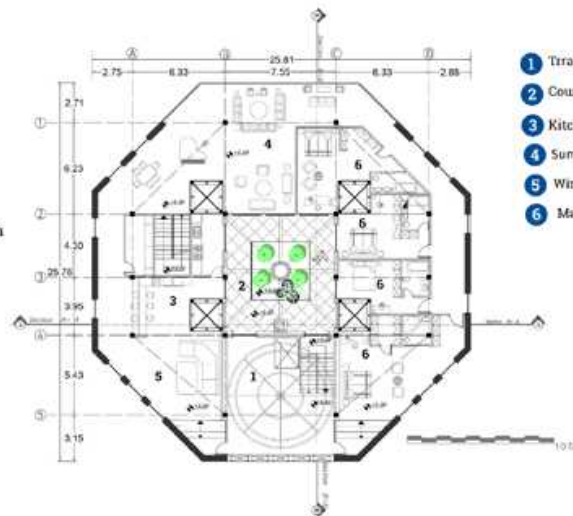

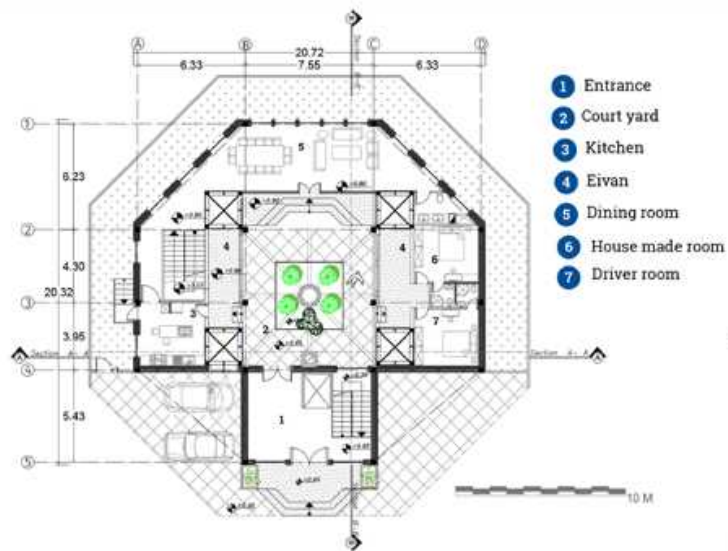

5 Cold air inlet from the floor

Cold Air passing through the soil enters the Majlis through the vents in the basement floor.
